Icing in flight can be bad! It can distort the flow of air over the wing, diminishing the wing's maximum lift, reducing the angle of attack for maximum lift, adversely affecting the handling qualities and significantly increasing drag. Don't miss this very important discussion of aircraft icing and effects, presented by Chris Dumont, from the FAA Technical Center.

Directions: Please preregister through FAASAFETY.gov for Wings program credit.

Message from the National FAASTeam Manager:

FAASTeam CFI Workshops start this Fall. Watch for them in SPANS...
